The main idea came when I thinking about how to design a place where can people meet, relax, educate. I was inspired by the main idea of bridge design. The bridges help people to overrule the barriers and they are design to connecting people. And this was the main idea of my design. Make the building which shape will looks like a bridge and have interior space designed for relaxation, education and leisure activities. This design solve a vitalize four huge pylons of former telpher line for Sandberg. Design of building respect the conditions of building design in flood land because construction of building is using the one of the basic element in bridge design - suspended construction. This solution make a great variability of interior spaces. And it also minimize number of barriers for the Morava river. The interior of the object make a endless contact for the human and nature. And also for the human and another guest of MP 4 S\_meeting point for Sandberg. This idea is perfectly improve in the main communication area - atrium. In this space is contact human-nature reached by the great glass area at the roof construction which make a interesting view at Sandberg.
